

## Product update: Pulley Safety Line.

At Best Kiteboarding, the R&D process never stops. As part of the development for the Bularoo, a simple pulley back-up system was created that would enable riders to retain control of their kite in the unlikely event that they should ever break a pulley during use of their kite.

Whilst not an immediate concern for most kitesurfers this simple to fit additional pulley backup allows the kiter to remain attached to their kite should a pulley fail. For snowkiters and landboarders this may make the difference between 'decking out' with a potentially injurious impact, or landing gently and being able to safely replace a damaged pulley.

The back up pulley safety line is comprised of a pair of 4mm thick , woven and closed loop extensions that are fitted by looping directly into the front flying attachment as shown above. Once fitted they provide maintenance free safety back up to the front pulleys suitable for use in any conditions and circumstances.

If you Snowkite or Landboard with a Waroo or Waroo Pro and are jumping or gliding across any sort of terrain, then the addition of a set of pulley safety lines is a sound investment in the safe and continued enjoyment of your kiting.

Ride safe.
