

## 08 Kite Range: technical product update.

Due to concerns regarding the suitability of the 08 valve design and use in cold climates we have taken the opportunity to revise the inflate/deflate valve design.

We will be changing the valves on all kite bladders from the stopper ball version to new membrane valves. This will go into effect starting with shipments to customers in mid to late January. The difference in design and function of the new valves is outlined below.

Each valve cap will have a suitable deflation prong stitched into the Velcro closure to ensure easy and rapid deflation.
