

Product Tech Update: Waroo 08 and Nemesis HP 'pulley safety' loops.

As the Bularoo is intended for snowkite use where riders may be a significant height above hard ground the Bularoo comes with a pair of 'pulley safety' loops fitted in the bridle to protect against catastrophic pulley failure. In the event of a pulley failure the bridle will remain intact for sufficient time to allow the rider to land and replace any failed pulley.

Pulley failures are incredibly rare, though very aggressive riders or those who do not regularly inspect the moving parts of their gear for wear are likely at an increased risk of breaking a pulley.

With this in mind and based on the use of multiple pulleys within the VP2 system on the Waroo and Nemesis HP, we have put together an instructional showing how to fit these 'pulley safeties' to the lower pulley within the VP2 system.

The 'pulley safety' lines will shortly be available on their Best website in the accessories section.
